

ABSTRACT

A walker system comprising a frame, a handle, a plurality of wheel assemblies, a pad assembly, and a post locking member.

5 The frame comprises a pad support. The handle is supported by the frame. The wheel assemblies support the frame. The pad assembly comprises a pad member and a pad post. The pad support slidably supports the pad post such that a position of the pad member relative to the frame can be changed. The post
10 locking member secures the pad post relative to the pad support to substantially fix the position of the pad member relative to the frame. Optionally, the handle member can be slidably mounted to the frame for movement between lower and upper positions.
